

Kjevik is a solid bollard for public spaces, paths and parks. It has a very high lumen output, with low energy consumption. The light distribution is wide and precise with all the light below the horizontal plane, therefore no light pollution in a safe and glare-free environment. Classic design blends in with all surroundings. A 180°-degree shield is available as accessory and is perfect for paths or other places where light should be restricted to a semi-circle.
