

TV outlet

Stylishly designed range of TV outlets. Straight lines give it an exclusive look. The aerial socket, which is 10 dB, can be used in both separate networks and star networks. The socket can be connected in series and terminated in the last outlet with a 75 Ohm terminal resistor in the last socket. The antenna socket can also be used in a star network, where the signal is collected in a distributor before being distributed with its coaxial cable to the different connections. This provides good isolation between each subscriber, preventing reflections.
